

Coolants

Many coolants will vary in the way they will transfer heat. Distilled water is generally accepted as the most efficient coolant. But a glycol-based coolant tends to increase the boiling point, lubricate the pump seal, reduce corrosion, and prevent freezing.

Many sanctioning bodies do not allow glycol-based coolants due to the track clean up. We strongly suggest using VR-12 coolant conditioner for all cooling systems. VR-12 is compatible with all anti freeze /coolants and certified by the USDA as an Eco friendly product requiring no Material Safety Data Sheets. VR-12 coats all the metal surfaces in your cooling system eliminating oxidation and mineral deposits which may cause electrolysis. For use in a racing environment we strongly suggest using VR-12 with distilled water. VR-12 contains No Glycol and is track safe.
